Digital Art

- Art that uses digital technology in one of three ways: product, process or subject
  - Art that uses digital technology as the product can be considered digital art. This includes categories like "web art" or "demo art." This is the most recognized definition of digital art.
  - Art that uses digital technology in the process of creation can also be considered digital art, even if the final product is not digital (computer graphics on film, digitally produced music, etc.
  - Digital art that references digital art as its subject can also be considered digital art. A series of oil paintings showing a man connected to an online chat room could be categorized as digital art, even though digital technology was never used in the creation or display of the work.

Taxonomy

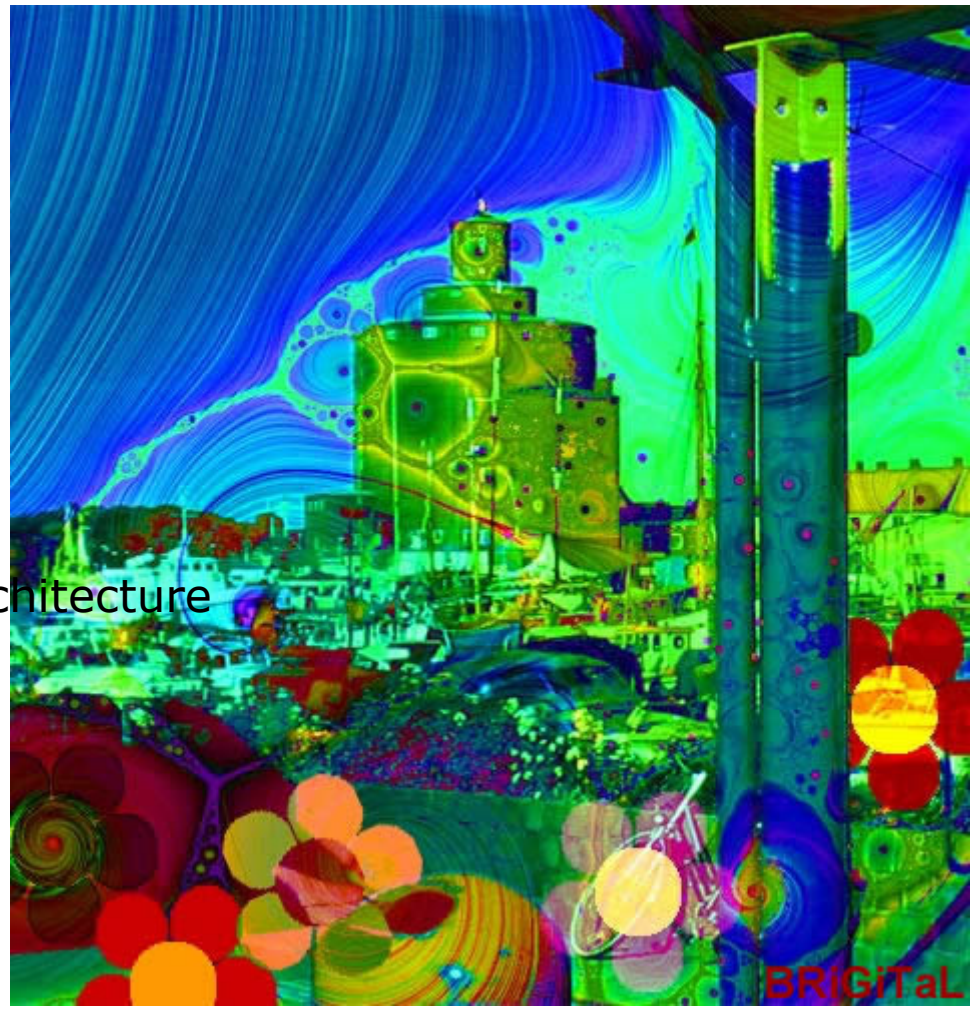

- Digital photography
- Movie special effects
- Digital imaging
- Photo manipulations
- Video game design
- Computer game
- Demoscene
- Computer art scene
- Pixel art
- Machinima
- Software/algorithmic art
- Electronic music
- Video art
- Digital poetry
- Video poetry

Taxonomy

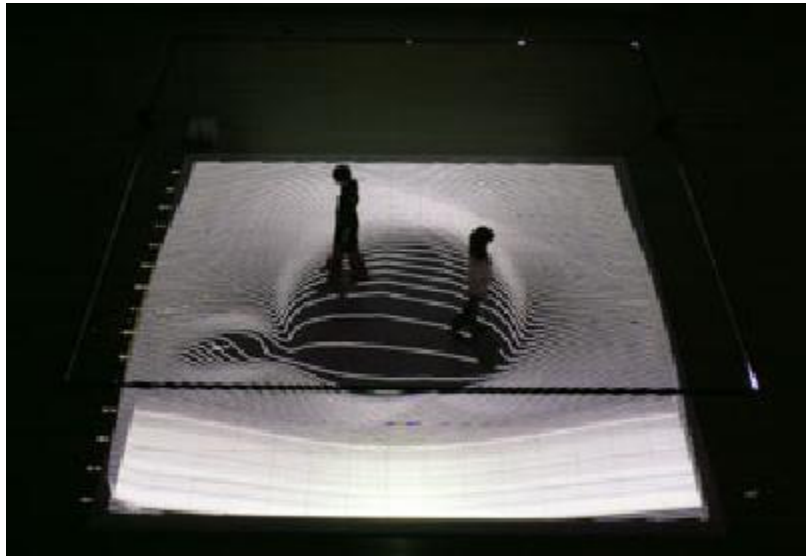

- Bio Art
- Computer Graphics/Animation
- Database art
- Genetic Art
- Virtual Reality / Immersive Architecture
- Interactive Art
- Net Art
- Cybernetics
- Expanded Cinema
- Kinetics
- Dance performance
- Multimedia performance
- Sound performance
- Robotics
- Sound installation
- Telematics
- Transgenic Art

Interactive Art

- SEIKO MIKAMI
  »gravicells – gravity and resistance«
  2004
  Yamaguchi Center for Arts and Media (YCAM)
- The name of this work comes from the relations between gravity and space, because the artists have tried to visualize gravity and its resisting force felt in the whole exhibition space from a sensor unit space to human cells. In the center of the installation space is a 6m x 6m floor with a built-in sensor. The moment a participant stands and moves on it, the variation of his or her position, weight, and speed is automatically and continuously measured, analyzed, and reflected on light, sound, and image, generating substantial spatial changes.

Interactive Art

- CHRISTA / LAURENT SOMMERER / MIGNONNEAU
  »The Living Web «
  2002
  ATR MI&C Labs
- This CAVE-based interactive and immersive installation explores the potential of the world-wide web as interactive and immersive data and information medium. In "The Living Web" users can immerse themselves physically and in 3D into this image and sound information streamed "live" from the Internet. Microphones pick up the users' conversations and use them to generate and download corresponding image and sound file from the Web. Users can furthermore interact with these data through intuitive interfaces and explore their content in more detail.

Interactive/Bio Art

- CHRISTA / LAURENT SOMMERER / MIGNONNEAU
  - »A-Volve«
  - 1994
  - La Villette Cité des Sciences et de l'Industrie
- The real-time calculation of an SGI machine automatically obtain the animated beings in the brightly lit water making them live. The survival of the creatures obeys a set of evolution rules. Artists observe the principle of "survival of the fittest": eat or be eaten. The shape on the touch screen allows the user theoretically to create creatures of any form. The length and size information is used in the genetic code together with a random set of information to add color and texture.

Intelligent Space

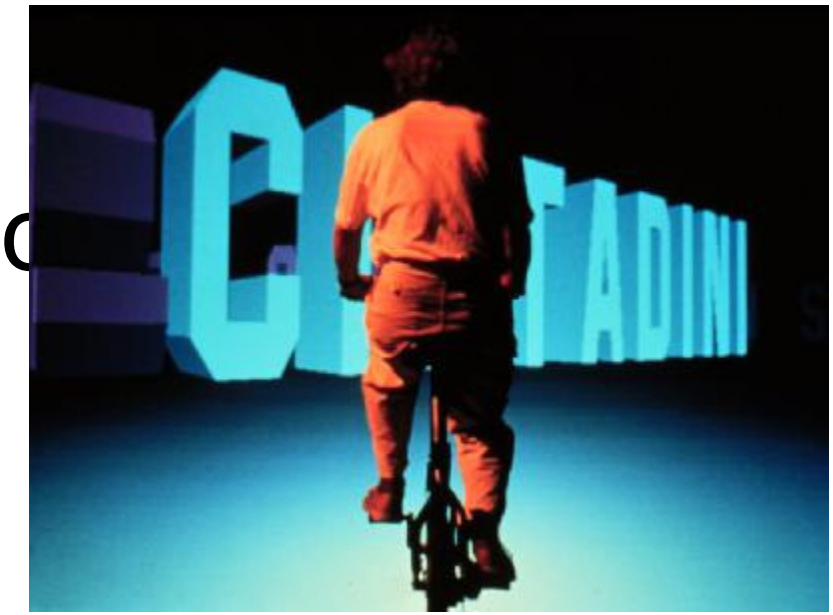

- GEORGE LEGRADY
  »SensingSpeakingSpace«
  2000
  San Francisco Museum of Modern Art
- "Sensing Speaking Space", is an interactive installation that focuses on the notion of the "intelligent space", a space that knows you are there and reacts to the presence and movements of multiple spectators sensed through a custom camera tracking system. The image is projected on a large screen, the sounds are spatialized around the audience through a 6 channel surround-sound based on their locations in the gallery. The visualization consists of the play between the noise, randomness and order, through multiple layerings and subtle changes that build up over time and in response to spectators movements.

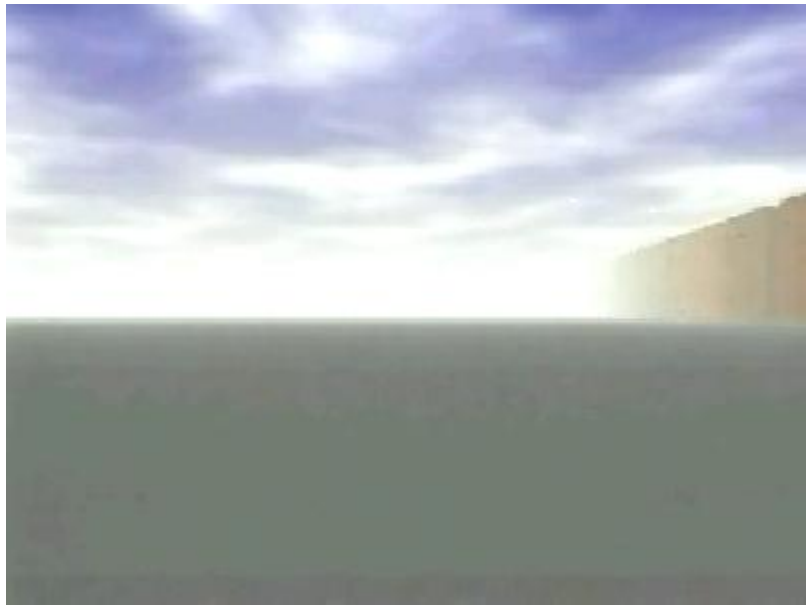

Computer Animatic

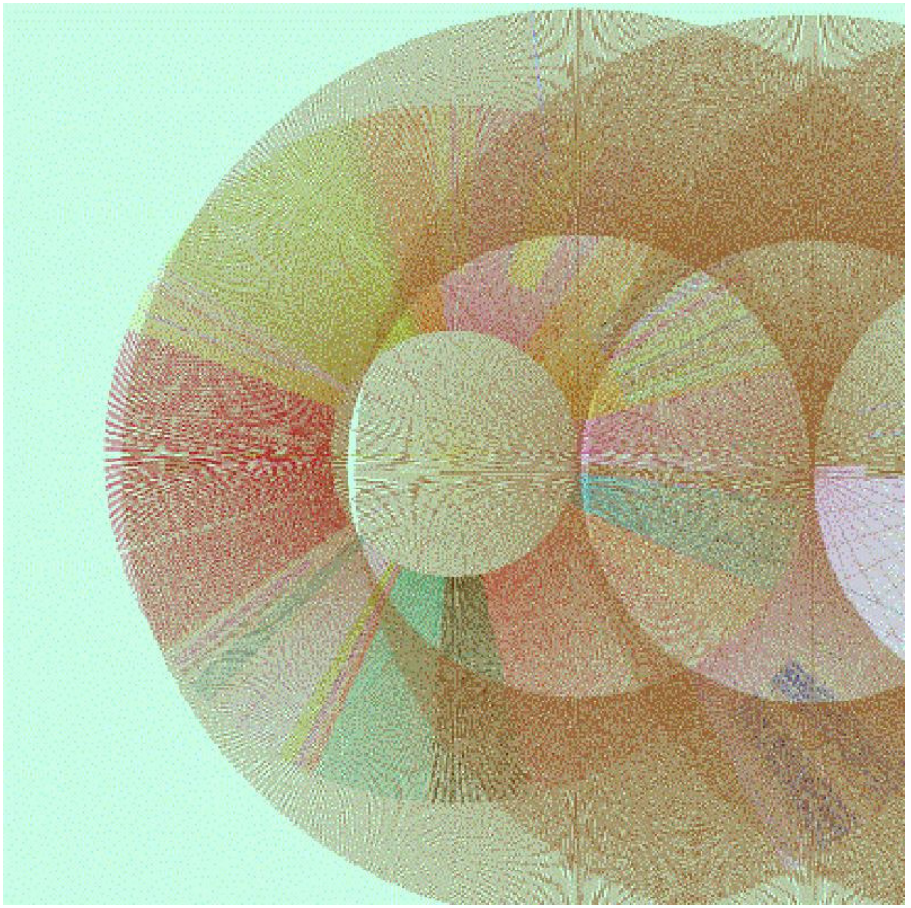

- JEFFREY SHAW
  »The Legible City «
  1989
- In "The Legible City" the visitors move on a stationary bicycle through the streets of a city seen on a projection screen. In contrast to a normal city line, in the "legible city" there are no houses or streets, but letters. On his way through the city the cyclists can follow different paths and make their own history of the city. On a small screen on the handlebars of the bicycle, a city map indicates the driver's position in the city.

Algorithm Art

- LEV MANOVICH
  »Data Beautiful«
  2001
- According to Info-Aesthetics Doctrine (www.manovich.net/IA), the society in which gathering, processing and distribution of information play central role needs its own art forms. These forms should take into account information behaviors and information interfaces employed by people in their everyday life, such as a search engine, a Web browser, email, GUI, databases, data visualization, and so on. […] Similarly, I postulate A Web crawler is beautiful. Quantitative data is beautiful. Multiple windows of GUI are beautiful. Email clients are beautiful. Instant Messenger is beautiful. Information is beautiful.

Algorithm Art

- JULIAN ADAMAITIS
  The Tunnel
  2001
- Use of fractals to create images.

Mixed Reality

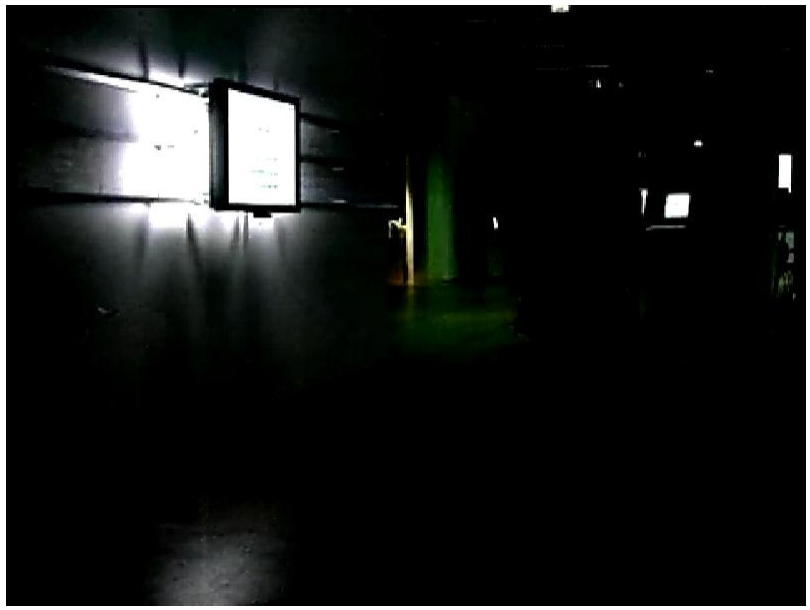

- GISELLE BEIGUELMAN
  »Poétrica«
  2003
- Poetrica is an investigation about reading and reception in entropic and cybrid situations and a practice of appropriation of the advertisement system as public space. The project involves a series of visual poems conceived by myself with non-phonetic fonts (dings and system fonts), a DVD, digital prints, movie trailers and a teleintervention which allowed anyone to send messages, by the Web or SMS, to three commercial electronic billboards located in downtown São Paulo. Messages were transmitted from 4 to 8 PM for 10”, every 3 minutes, following the order of ads scheduled to be broadcast in the same billboards. Poetrica website archives all messages with captions that identify the original text written before its conversion in an iconic font family, revealing in some ways a community of poetic hackers of the telecommunication system who acts in public spaces.

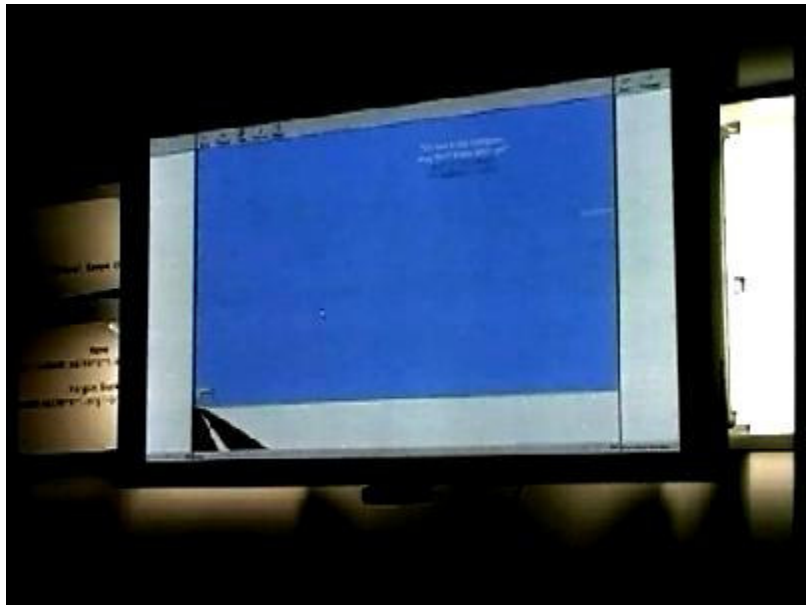

Net Art

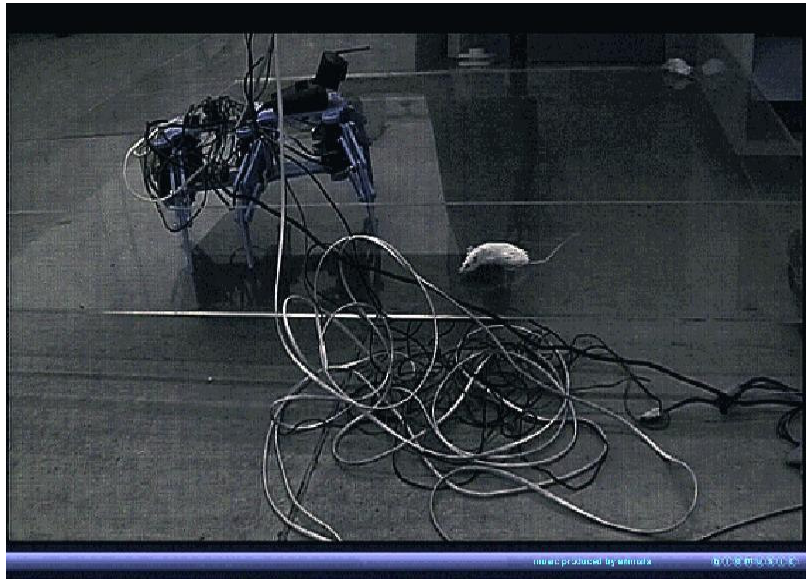

- JEFFREY SHAW
  »The Net.Art Browser «
  1999
- The Net.Art Browser is a means of conjoining information space with the museum space and hybridizing the interactivity of surfing the Internet with the museum tradition of wall mounted images. While painting, cinema and TV construe images inside a fixed frame, the notion of 'augmented reality' that accompanied the development of the virtual reality technologies offers the new paradigm of a mobile viewing window that reveals images that are spatially embedded in the real environment. Using this model, the Net.Art Browser's web sites, curated by Benjamin Weil, are virtually placed side by side along a white wall. A motorized large flat screen (linked to a cableless keyboard) allows the viewer to move this display window linearly (in either direction) from one Internet-connected web site to another.

Robotics

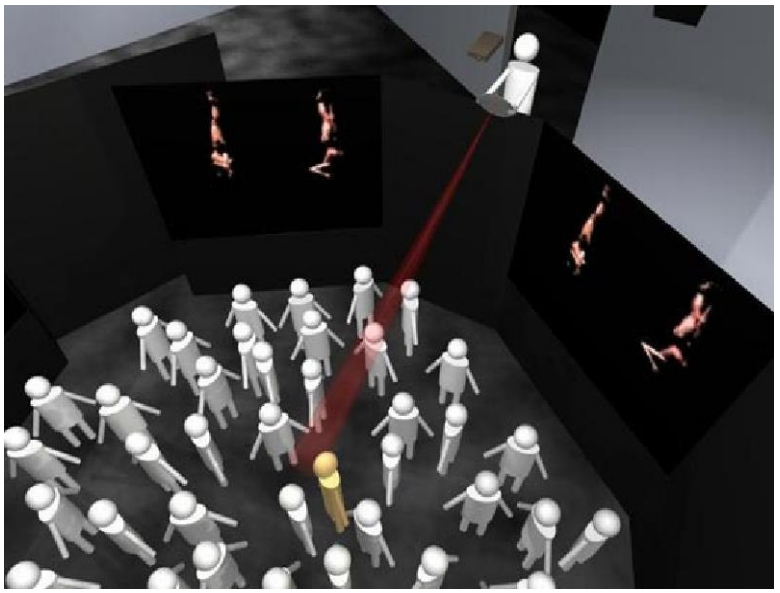

- YIANNIS MELANITIS
  »Bio-Robotic Symbiosis«
  2001
- An integrated environment for animal-machine co-existence Bio-robotic symbiosis features a hexapod robot, two laboratory mice and the audience. The robot and the mice co-exist in a transparent plexiglass stand that is accessible to the audience. A video camera is attached on the robot sending image data to an originally designed Java program running on a PC. The program analyzes the video input in order to generate random sound and issue motion commands to the robot.

Mixed Installation

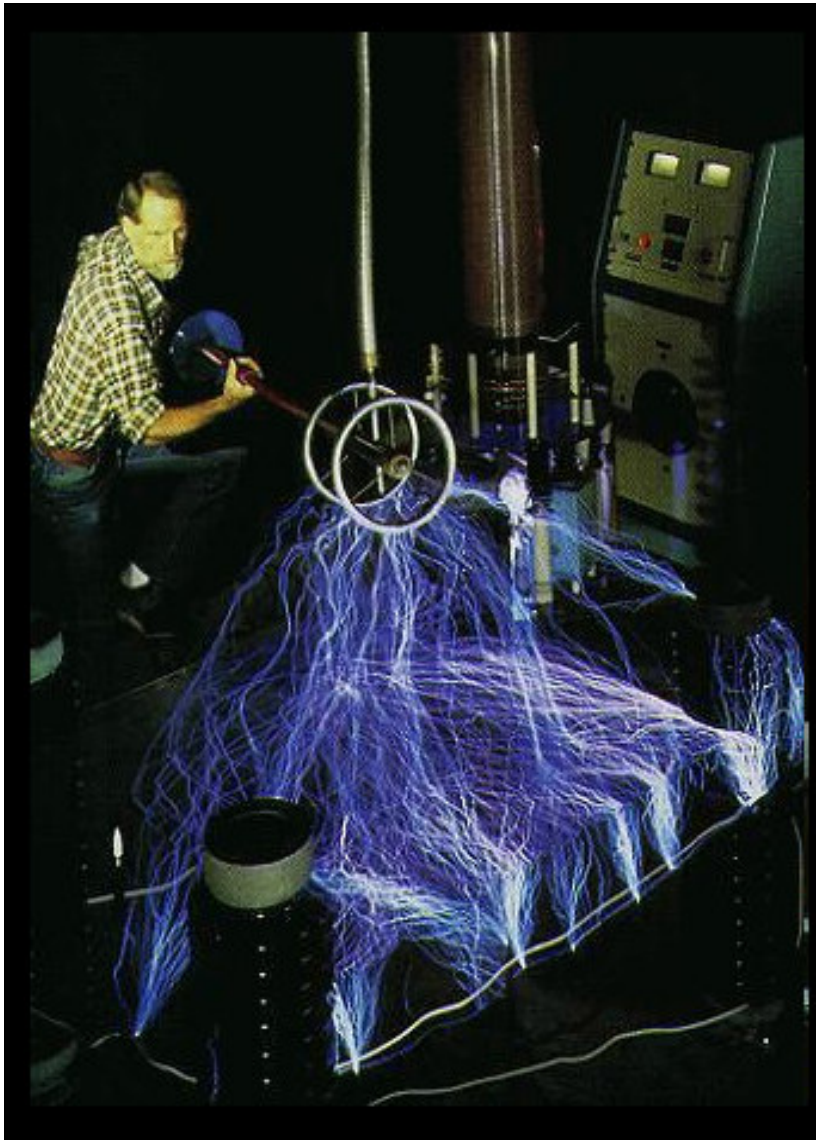

- REBECCA ALLEN
  »The Brain Stripped Bare«
  2002
- This work considers a future where we live simultaneously in multiple realities, where the boundaries between physical and virtual reality are blurred and thoughts are expressed telepathically. Advanced technology can provide an enhanced life experience but with this comes sophisticated forms of surveillance that track our behaviors, our movements and our identity. Unlike traditional theater that separates the audience from the performers, the performers surround and infiltrate the audience. Surrounded by a circle of screens the audience is free to shift their point of view. Live performers merge with shadows, projected images and sounds, revealing stark human forms that move in startling and perplexing ways. This creates a raw, very physical yet illusory interactive experience that connects an audience to a performance in a way not previously explored. (Rebecca Allen)
