THE COMPANY – ATLAS

HISTORY

ATLAS is a company located in Oporto, which aims to create an application to improve the daily lives of students and workers at the University of ISEP.

CONCEPT

Just like the mythological figure who carried the world on his back, the Atlas concept follows a similar path by presenting the knowledge to determine the best trajectory.

MISSION

This application is intended for ISEP students who intend to participate in a class and/or event on the Campus premises, within the scope of the Magno auditorium, in addition, it seeks to include people with disabilities (for locomotion or visual) through routes inclusive.

VISION

We intend that our application be recognized and used in the long term by ISEP, as well as possibly future other universities. The company also aims to reach a large audience, specifically those who attend large events and need practicality when arriving at a certain location, a priori the university public, but later cover other types of events such as meetings, forums, congresses, parties, etc.

VALUES

- **Design –** Easy and intuitive.
- **Utility –** Aim to guide teachers and visitors to the Magno auditorium, using the best possible route.
- **Accessibily** – The routes will be weighted according to the user's needs (motor disability).

GENERAL RESOURCES: HUMAN, TECHNOLOGY, FINANCIAL

1. HUMANS

The team dedicated to the creation of the product is structured in:

Team Leader	Mayron Martins

QA/Tester	Mayron Martins Luís Esteves
Server Manager	Mayron Martins
Database Manager	Wenderson Silva Filipe Rodrigues
UI/UX Design | Mobile Application	Isaac Barroca *(Design Leader)* Luís Esteves
UI/UX Design | Web Application	Sandro Moura Tiago Machado
Front-End Developer | Mobile Application	Isaac Barroca Luís Esteves
Front-End Developer | Web Application	Sandro Moura *(Front-End Leader)* Tiago Machado
Back-End Mobile Application	Jorge Silva *(Back-End Leader)* Luís Ricardo
Back-End Web Application	Wenderson Silva Filipe Rodrigues

2. TECHNOLOGY

For the mobile application, Kotlin will be used as the main language and Android Studio, with the focus of this project being an application for Android devices.

For the web portal, tailWind will be adopted together with React.

The relational database will use MySQL while the non-relational database will use MongoDB.

The Application Server will be built within Amazon Web Services on the Elastic Computer Cloud. The server will be created on Linux and will consist of a reduced relational database (MariaDB) and a manager (PHPmyAdmin), a Web Server (Apache Server), a non-relational database (MongoDB), and PHP resources.

The mobile application will have code stored directly on GitHub, with requests to databases via REST API. For access and interpretation of geolocation, the Google Maps API will be used.

3. FINANCIALS

Since the application is being developed within an academic context, the only expense in application development will only be time consumption. All members do not have any financial gain during development.

THROUGH THE ANALYSIS OF THE COMPANY ENVIRONMENT

ECONOMIC CONTEXT

Taking into account that the project is academic in scope, there is no financial capacity to sustain the possible long-term costs of keeping the application in full operation.

SOCIOCULTURAL CONTEXT

The company impacts the university's social environment in the sense that it provides information to professors about events/classes that will take place and how to get there efficiently, thus facilitating the day-to-day of these same professors.

TECHNOLOGICAL BACKGROUND

Use of beacon technology to provide the best route for the application user with greater precision.

ANALYZE SURROUNDING ENVIRONMENT

CLIENTS

Customers will be university students and workers looking for the easiest and most effective way to get to the Auditorium Magno, as well as find out about all the events or classes that will take place there.

DIRECT COMPETITORS

Except team 1, competitors that use Beacons in their constitution were not found in the store for Android devices. However, standard location services (such as Google Maps) become potential competitors, since they bring a broad view of space, but have not yet delved into the internal spaces of the entire institute.

INDIRECT COMPETITORS

There are no direct competitors, as location applications do not tend to include university interiors.

SITUATION IN THE LONG TERM

NON-FINANCIAL

- Be recognized as the best application to help university students and workers;
- Encourage university students and workers to use the tool;
- Manage to provide the application to several universities;
- Get high app usage.

FINANCIAL OBJECTIVES

- Raising possible financial sponsorships with other universities and companies to support future costs of maintaining the service.

MARKETING MIX DA EMPRESA: 7 P'S DE MARKETING PARA SERVIÇOS

1. PRODUCT

The product is an immaterial (intangible) good offered to the market, aiming to satisfy the desires or needs of the customers.

The product of this company is the ATLAS application. It should be noted that it is a superior quality product, innovative, with a specific design assigned to specific customers to make their day-to-day easier.

2. PRICE

The Atlas application is free because it is being developed in an academic context, so we want it to be available to the general public.

3. PLACE

It is a set of elements that aims to make the product available to consumers wherever and whenever they want. This includes elements such as distribution channels, market logistics and some variables that integrate these elements. That said, the products reach our customers through app stores, which are important for consolidating the brand with greater credibility and recognition. It is essential to show the products to existing customers and create contacts with potential customers.

We can say then that the end user only has access to our products through the app stores.

4. PROMOTION

Communication is not limited to informing the market about a product/service. It aims to develop communication that leads the customer to want to use the product to meet their needs.

This product is promoted within the academic community, universities and app stores so that all users know about the existence of the product.

Since people spend a considerable amount of time on social media, we will use them to promote the app through occasional posts.

5. PEOPLE

It is the team interacting with the customer, these can be called personal contact or service providers. The product is sold online, so contact is always virtual.

In this sense, it is worth highlighting the community's contribution to application validation and correction suggestions.

6. PHISICAL EVIDENCES

Due to the intangibility of services, it is difficult for customers to objectively assess their quality, especially during the negotiation period, when customers are often still forming their opinion of the company. Therefore, they often rely on tangible evidence about the service to help them make assessments.

The physical evidence of the company then includes ratings and opinions given in the app stores, and Play Store and also ratings and suggestions sent directly to the support and development team.

7. PROCESES

In short-contact services, the customer is not directly involved in the production process, so the product is defined by fewer attributes.

It is important that the customer feels close to the company. For this, the entire flow of activities that produce the service must be described: customer follow-up in their first contacts with the company - detailing all the necessary steps for negotiation - their involvement throughout the service development process and completing reports as after-sales relationship and/or service execution is done.

For the end customer, the process he will be involved in will be bug resolution.

SWOT

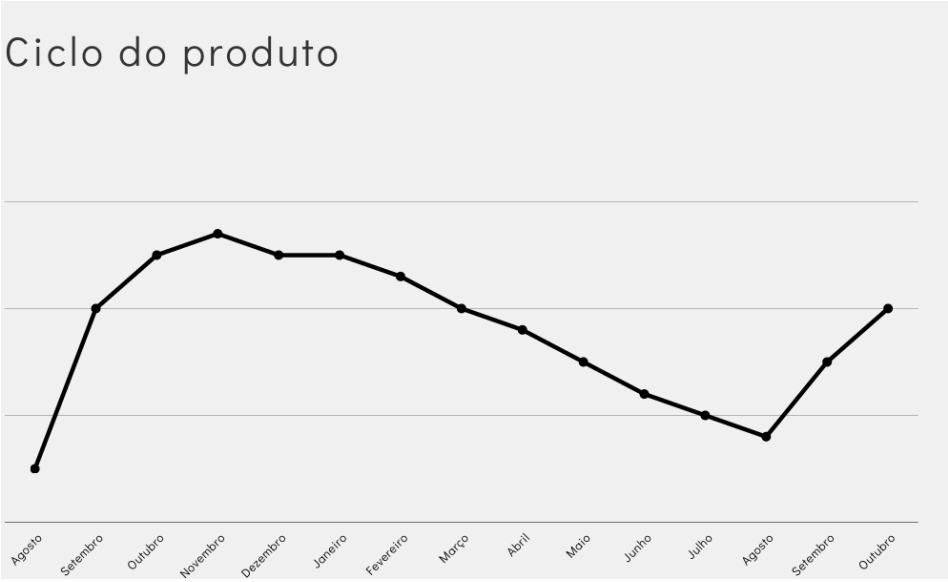

GENERAL STRATEGIES
PRODUCT LIFE CYCLE AND BCG MATRIX
Product life cycle

At ISEP Indoor, the product life cycle depends on several factors. Like any other product on the market, the product offered is likely to be copied, so the product cycle depends on the ability of others to replicate the product, the needs of the market for the application, the evolution of the market (best available tools) making the obsolete application.

It is important to highlight the events themselves within the auditorium since at first it will be used basically to determine a trajectory for it. Therefore, if there are few events or it is not used frequently, there are chances that the application will fail.

However, the application, depending on its function, can be traced as a trajectory with a forecast of decline over time during the year, thanks to the little need for repeated use over time. At the end of the school year, although there is a decline to the expected lowest point, with the start of a new school year, with the entry of new students and

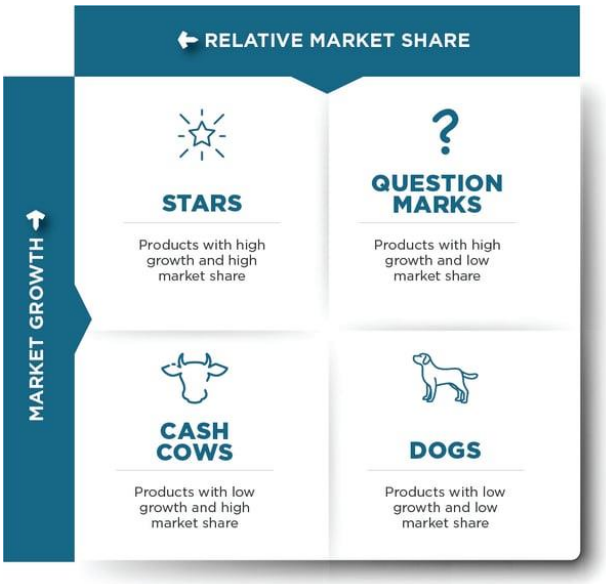

potential users, it is expected that the use of the App will increase again during the months following.

It is also important to note that, although it cannot be represented in the graph, the application is expected to have a large increase in use, in weeks/days when there will be events at the Magna Auditorium, or guests from other schools visiting the University.

BCG Matrix

The BCG Matrix is a method to analyze the life cycle of a product, manage brands, carry out strategic planning and even carry out a sales strategy. The method is quite comprehensive and is used as a marketing strategy, as it helps us to understand through a simple graph the market share or the growth rate of any product or service market.

1. Stars: Products with the best market share and that generate the most money are considered Stars. Monopolies and pioneering products are also often referred to as Stars. However, due to their high growth rate, Stars consume large amounts. This usually results in the same amount of money coming in and going out. Stars can eventually become Cash Cows if they maintain their success until a high-growth market slows down. A key tenet of BCG's growth strategy is investing in Stars.

2. Cash Cow: A Cash Cow is a market leader that generates more cash than it consumes. Cows are business units or products with high market share but low growth prospects. Cows provide the cash needed to turn a question mark into a market leader, cover the company's administrative costs, etc. Companies are advised to invest in Cows to maintain the current level of productivity or passively “milk” the earnings.

3. Dog: Dogs, sometimes also called pets, are units or products with low market share and low growth rates. They often break even, neither earning nor consuming much money. Dogs are generally considered money traps because companies have money tied to them, even if they bring almost nothing in return. These business units are prime candidates for divestment.

4. Question Mark: Have high growth prospects but low market share. They consume a lot of money, but bring little in return. Question Marks lose the company money. However, as these units grow rapidly, they have the potential to become Stars in a high-growth market. Companies are advised to invest in Question Marks if products have growth potential, or sell if they don't.

The ATLAS App in this initial phase can be considered in the Dog phase, that is, products with a low market share, with low/no return on equity and that, require investments. Furthermore, because it is only available to university students/workers, it has a low market share and zero sales profit, but a high consumption volume.

FACTORS – KEY OF SUCCESS

The first success factor is that the application simplifies the day-to-day of any student or worker at any university, with a simple and easy-to-use tool anyone can reach the large auditorium from anywhere as long as they are within the university in shortest possible time.
